### **ABSTRACT OF THE DISCLOSURE**

4

5        An implement pitch-yaw system for effectively and efficiently controlling the  
6        pitch of an implement. The implement pitch-yaw system includes a first yaw actuator  
7        and a second yaw actuator attached between an implement structure pivotally attached  
8        to a support structure and a connecting member slidably attached to the support  
9        structure, and a pitch actuator attached between the connecting member and the  
10       support structure. The extension/retraction of the pitch actuator moves the yaw  
11       actuators accordingly thereby creating the desired pitch movement for the implement  
12       structure.
